The invention relates to an isolated B7-like (B7-L) polypeptide (1). The polypeptide, polynucleotide encoding it and antibody against (1) are polypeptide, polynucleotide encoding it and antibody against (1) are conditions including relative disorders (e.g. infertility, conditions including reproductive disorders (e.g. infertility, ansatzing, preterm labour and delivery and endometriosis) and miscartiage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are entranged in manne response to tumours. (1) plays a role in growth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer including seminal vesicle diseases and autoinmune diseases. T-cell dependent B-cell mediated diseases and autoinmune diseases. T-cell dependent B-cell mediated diseases and autoinmune diseases involving chronic call mediated diseases and autoinmune diseases involving chronic coll munus erythematosus, rheumatoin architis, multiple sclerosis, diseases unche as inflammatory bowel disease (Tcohn's diseases such as inflammatory bowel disease (Crohn's disease and ulcerative colitis), Grave's disease (Crohn's disease and transplantation or to prolong graft survival. B7-L cone marrow and organ transplantation or to prolong graft survival. B7-L cone marrow and organ transplantation or to prolong graft survival. B7-L cone marrow and proventive and portanes of sequence of human diseases, which diseases (e.g. glomerulouephritis), skin disease, sinvolyving abnormal cell proliferation; including arterioscierzes (e.g. glomerulouephritis), skin diseases, and for treatment of allerys, asthmismoty, skindiscopers, thomerolar cell proliferation useful for diagnosing, preventing and treating reproductive, immune and proliferative disorders, e.g. cancer and arteriosclerosis. New B7-like polypeptides, polynucleotides and their modulators, Chute HT; Schultz HJ, Claim 13; Fig 2; 135pp; English. 28-JUN-2001; 2001WO-US020719. 28-JUN-2000; 2000US-0214512P. 28-NOV-2000; 2000US-00729264. The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are polypeptide, polynucleotide encoding it and antibody against (I) are conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and conditions including reproductive disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer including seminal vesicle cancer, lung, brain, breast, ovarian, catesticular cancer and cancers of haematopoietic system. B7-L polypeptide pathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases. B7-L molecules are useful

       bone marrow and organ transplantation or to prolong graft survival. B7-L bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock sydrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anamemia, thrombocytopenias, Guillain-Barres syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L_h1
                                                                                                                                                                                                                                                                                                                                                                                                                                                        64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      84

The polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and

proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (1) plays a role in growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence medulators of (1) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide pathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-C call mediated diseases and autoimmune diseases. B7-L molecules are useful for alleviating the symptoms associated with diseases involving chronic immune cell dysfunction or to treat autoimmune diseases involving chronic immune thrombocytopenic purpura and psoriasis, chronic inflammatory cimematory bowel disease (Crohn's disease and clieves thacking and clieves mellitus. They are also useful disease (Crohn's disease and clieves are also useful for diagnosis and treatment of diseases and clieves are also useful for diagnosis and treatment of diseases and clieves are also useful for diagnosis and treatment of diseases and clieves are also browned to the diagnosis and treatment of diseases and coll toy are also useful for diagnosis and irreatment of diseases and clieves are useful for training and clieves are useful for training allowing and treatment of browned to the browned of the colling and treatment of browned to the browned of the colling and treatment of the browned of the colling and treatment of browned to the browned of the colling and treatment of the browned of the colling and treatment of the browned of the transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenies, Guillain-Barre syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L-h3 \$

useful for developing a diagnostic their expression and activity, or New polynucleotides and polypeptides, marker or medicines for regulation of as targets of gene therapy.

Claim 1; Page; 222pp; English

The invention discloses a polynucleotide comprising a sequence selected

```
polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide or its partial peptide, immunologically assaying the polypeptide or peptide of the polymucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an observable manner and an antisense polymucleotide. The oligomucleotide is useful as a primer for synthesising the polymucleotide, or as a probe for detecting the polymucleotide and encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, disease-related proteins, transcription-related proteins, disease-related proteins are conciding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate and manner processine of the encoded protein of the invention Note. Some of the

The polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, B7-like protein, B7-L, antiinfertility; gynaecological; antitumour; cytostatic; immunosupressive; antiarthritic, antirheumatic; antiinflammatory; dermatological; antipsoriatic; neuroprotective; antidiabetic; hemostatic; antibhyroid; antiulcer; antiallergic; antibacterial; virucide; tumour; cancer; reproductive disorder; graft versus host disease; autoimmune disease; toxic shock syndrome; allergy; nephropathy; skin disorder; endocrinopathy; lymphoproliferative disorder;

useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of ceminal vesicle hyperplasia in transgenic mice overexpressing BV-L polypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cefficial remover and cancers of haematopoietic system BV-L polypeptide to pathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease. B7-L molecules are useful cor alleviating the symptoms associated with diseases unch as systemic immune cell dysfunction or to treat autoimmune diseases unch as systemic cor immune thrombocytopenic purpura and psoriasis, chronic inflammatory can servitematory bowel disease (Crohn's disease and ulcerative colities). Grave's disease, Hashimoto's thyroiditis and diseases mellitus. They are also useful as immunosuppressive agents for ulcerative colities), Grave's disease, Hashimoto's thyroiditis and classes mellitus. They are also useful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases convaced involving abnormal cell proliferation, including arteriosclerosis and convacular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, nephropathies (eg. glomment) and phyperpressive disease, collade extrains and pemphigoid), endocrinopathies (Grave's disease), various penumopathies (eg. glomment of alleviation and mysthemia collapsatics (pemphigus and pemphigoid), endocrinopathies (eg. glomment syndrome and mysthemia collapsatics) anaemia, thrombocytopenias, Guillain-Barre syndrome and mysthemia concept sequence represents the amino acid sequence of human B7-L hat

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRIS primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this electronic format directly from MPO at a cleatronic format directly from MPO at the printed specification, but was obtained in electronic format directly from MPO at

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human fortal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pot_sequences
by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical and and order. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #9548 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          claim 27; SEQ ID NO 34677; 639pp + Sequence Listing; English.

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to single exon nucleic acid probes (SENP: see AAI3115-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                   Peptide #9881 encoded by probe for measuring placental gene expression.

measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                       Protein #7653 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to single exon nucleic acid probes
                                                                                                                                                                                    Human, gene expression, heart, microarray, vascular system,

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                       Human, brain expressed exon, gene expression analysis, probe, microarray,
Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy, cancer.
             Human brain expressed single exon probe encoded protein SEQ ID NO: 35028.
                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. It may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABC47348-ABG59310 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 27; SEQ ID NO 36121; 658pp; English.

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 27; SEQ ID NO 34884; 634pp; English.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived cucle probes for measuring gene expression in a sample derived crommunan lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 1287 open reading frames derived from the 12614 complements or the 12887 open reading frames derived from the 12614 complements or the human lung; measuring gene expression in a sample cid expressed in the human lung; measuring gene expression in a sample conclection of detectably labeled nucleic acids derived from human lung mans, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (a) calcation of detectably betwaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, comprising (a) identifying exons from genomic sequence by the method in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) identifying exons from genomic sequence by the method tissues and/or cell types using hybridisation to a single exon comprising (c) microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising of 12011 sequences, mentioned in the specification, or encoded by the compression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising of 12011 sequences, mentioned in the specification, or encoded by the conservable mi disease (LDD), familial idiopathic pulmonary disease (COPD), interstitial lung disease (LDD), familial idiopathic pulmonary fibrosis, neurofibromatosis, disease (LDD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuuberous selerosis, Gaucher's disease, Niemann-pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary hypertensis, pulmonary alveolar proteincy Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary present squence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

The nGPCR-x can be used for screening compounds which can be used to treat mental disorders, thyroid disease, renal failure, inflammatory conditions such as Crohn's disease, rhematoid arthritis, autoimmune disorders schizophrenia, migraine, stroke, dementia, odisease, they may also be used for treating viral infections such as human immunodeficiency virus (HIV), type 2 diabetes, obseity, anorexia, hypotensian, hypotensian, thrombosis, myocardial infarction, atherosclerosis, cancer, and sexual dysfunction. AAUZ5617-AAUZ5726 represent the amino acid sequences of novel human G protein-coupled

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABH72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

Peptides AAY65684-Y66142 are fragments of mutant proteins arising from a crameshift mutation in a gene from a cancer cell. The peptides are charactersised in that they: (i) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant part of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the morant part of the protein sequence preceding the amino terminus of the mutant sequence and may betwrined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 cellings, or a di-nucleoside base repeat sequence of at least 5 cellings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleoside base units. The peptides are created by the addition or deletion of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit 7 cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a
                                                                                                                                                                                                                                                                                                                                                         Human; frameshift mutant; T cell response; tumour; treatment; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides derived from genes with frameshift mutations, used to develop products for the treatment and prophylaxis of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Saeterdal I;

Crameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i,) are at least 8 amino acids long and a characterised in that they: (i,) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant protein sequence encoded by the gene, (iii) comprise 0-10 amino acid from the carboxyl terminus of the normal part of the protein sequence preceding the amino terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant sequence and may sequence preceding the amino terminus of the mutant part of the protein as determined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses. The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 cartigen of 1 or 2 nucleoside base residues from the repeat sequence. The nucleoside base residues from the repeat sequence. The nucleoside base residues from the repeat sequence. The covel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a composition for the treatment or prophylaxis of cancer
                                                                                                                                                                                                                                                                                                                                                                 Human; frameshift mutant; T cell response; tumour; treatment; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consists of at least one amino acid of the mutant part of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the mormal part of the protein sequence preceding the amino terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant sequence and may as determined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC). T cell responses. The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 residues, or a di-nucleoside base repeat sequence of at least 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleoside base units. The peptides are created by the addition or deletion of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a

                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL0440-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell in development of higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), processed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                               Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; SEQ ID NO 33909; 21pp + Sequence Listing; English

New polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance, useful for conferring resistance or tolerance to a plant
                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disease resistance; pathogen tolerance; plant pathogen; plant; rice.
                                                                                                                                                                                                      ID NO 28224; 21pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elunidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL30511), expressed DNA sequences (ABL10140-ABL16175) and the encoded proteins (ABBS7137-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   developmental biology; cell signalling; insecticide;

The invention relates to a novel isolated polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having substantially the same activity as the full-length polypeptide. The polynucleotide of the invention is useful for conferring resistance or tolerance to a plant pathogen. The present sequence represents a protein conferring disease resistance used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense

                                                                                     The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BTG; acyl rearrangement; deamination; yeast; actinomycetes.

The protein sequence given has transglutaminase (BTG) activity. The DNA encoding this protein has a base sequence which can be used suitably in an expression system using B. coli or yeast as a host. The base sequence can be compared to those given in AAQ24197 and AAQ24200 which are derived

DNA fragment encoding trans:glutaminase - is inserted into vector, e.g.

for protein expression.

from Actinomycetes sp. BTG catalyses an acyl rearrangement reaction of a gamma-Carboxyamide gp. of glutamine. It introduces intra- or intermolecular formation of epsilon-(gamma-Gln)-Lys cross-linking when an epsilon-amino gp. of a Lys residue acts as an acyl receptor. When water acts as an acyl acceptor the enzyme accelerates the conversion of Gln residues to Glu residues by deamination. The enzyme is used in the prodn. of gelled foods, gelled cosmetics, yogutt, gelatin, cheese etc. It is also used in the prodn. of thermally stable materials such as microcapsules and carriers of immobilized enzymes. The DNA sequence given 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel bacterial transglutaminase polypeptide. (I) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste. (I) can also be used to immobilize enzymes and antibodies. This sequence represents a transglutaminase protein fragment isolated from Streptoverticillium mobaraense. (Updated

                                                                                                                              Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel bacterial transglutaminase polypeptide.

(1) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste (1) can also be used to immobilize enzymes and antibodies. This sequence represents a transglutaminase isolated from Streptoverticillium S-8112. (Updated on 17-OCT-2003 to

Streptomyces sp.

EP889133-A2.

A transglutaminase enzyme sequence.

(first entry)

```
The present sequence represents a transglutaminase of Streptoverticillium sp. . The specification describes a new microbial transglutaminase that has the N-terminal separtic acid of the present transglutaminase deleted. Bliminating the N-terminal Asp from microbial transglutaminase allows efficient removal of the terminal Methionine residue added when the protein is expressed in Escherichia coli. The E. coli methionine aminopeptidase acts well on Met-Ser but only poorly on Met-Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce gelled foods meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes. The present invention describes a method for designing and constructing a variant transglutaminase by estimating the binding site of Streptoverticillium mobaraense-oxiginated transglutaminase (MTG) to the substrate based on the stereo-structure obtained by X-ray analysis of the crystalline structure of MTG crystals, and e.g. substituting amino acid residues located at the substrate-binding site of the transglutaminase. The method can be used for designing and constructing a variant transglutaminase. The modified transglutaminases can be used in food processing. The modified transglutaminases have improved transglutaminase activity and thermal stability, substrate-specificity and an less acquired optimum pH. The present sequence represents a transglutaminase isolated from Streptoverticillium mobaraense (also called Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Designing and constructing a variant of Streptoverticillium mobaraense-originated transglutaminase (MTG), for use in food processing, comprises estimating the binding site of MTG based on its stereo-structure.
                                                                                                                             Microbial, transglutaminase, protein co-ordinate data, stereo-structure, X-ray analysis, crystalline structure, enzyme, food processing, thermal stability.
                                                                                        Streptoverticillium mobaraense transglutaminase protein SEQ ID NO:2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               349 CCTTACCGTCCAAGTTATGGGAGGCT 375

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the vector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmacoutical industries. The present sequence represents a transglutaminase related protein, which can be used in the method of the invention. (Updated on 11-SEP-2003 to standardise OS

The present sequence is encoded by the high expression transglutaminase gene present in plasmid pTRPMTG-02. The gene is derived from Streptoverticillium sp., and is codon altered, using oligonucleotides AAV81231-60, for expression in Escherichia coli. The specification describes a new microbial transglutaminase that has the N-terminal aspartic acid of transglutaminase deleted. Bliminating the N-terminal App from microbial transglutaminase allows efficient removal of the terminal Met residue added when the protein is expressed in E. coli. The E. coli methionine aminopetidase acts wellon Met-Ser but only poorly on Met-
                                                                                                                                                                                                                                                                                                                                                                                               New microbial transglutaminase with N-terminal aspartic acid deleted - allowing high level recombinant production without added methionine in E. coli, useful in production of gelled foods, cosmetics etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transplutaminase is used to produce gelled foods (fellies, vogurt and cheeses) or cosmetics, to improve the quality of meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes

The present invention describes a method for producing active transglutaminase from denatured enzyme. The method comprises: (i) forming an intermediate structure of the enzyme having transglutaminase activity under acidic conditions in an aqueous medium; and (il) forming a higherneutal conditions in an aqueous medium: The method can be used for industrial production of active transglutaminase activity under industrial production of active transglutaminase from denatured material isous as recombinant transglutaminase) which can be used in the food industry for the production of gelled foods such as jellies, yophurts and cheeses, and for the production of gelled cosmetics. The present sequence represents a transglutaminase which is used in the exemplification from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     variant transglutuaminase by estimating the binding site of streptoverticillium mobaraense-originated transglutuaminase (WTG) to the substrate based on the stereo-structure obtained by X-ray analysis of the crystalline structure of MTG crystals, and e.g. substituting amino acid residues located at the substrate-binding site of the transglutaminase. The method can be used for designing and constructing a variant transglutaminase. The obtained transglutaminases can be used in food processing. The modified transglutaminases have improved transglutaminase activity and thermal stability, substrate-specificity and an less required optimum ph. The present sequence represents a transglutaminase isolated from Streptoverticillium mobaraense (also called Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polyvalent antigen; pAg; antigen; Ag; crosslinking; biological agent; virucide; antibacterial; fungicide; antiparastic; cytostatic; nootropic; neuroporotective; vaccine; immunogenic; antigenic; medicine; infection; cancer; Alzheimer's disease; immune-related disease; autoimmune disease; Streptomyces mobaraensis; transglutaminase; EC 2.3.2.13; enzyme.
                                                                                                                                                                                                                                                                                                                                              Designing and constructing a variant of Streptoverticillium mobaraense-originated transglutaminase (MTG), for use in food processing, comprises estimating the binding site of MTG based on its stereo-structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         present invention describes a method for designing and constructing
                                                                                                                                                                                                                                        Shimba N, Ishikawa K, Suzuki E, Yokoyama K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptomyces mobaraensis transglutaminase SEQ ID NO:6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    332

The present invention describes a method for producing a polyvalent antigen (pag). The method comprises: (i) treating an antigen (Ag) in a crosslinking solution with a biological agent (I); and (ii) incubating so that Ag is converted to crosslinked agent (I); and (ii) incubating so cuberial, fungicide, antiparasitic, cytostatic, nootropic and comportective activities, and can be used in vaccines. The method is useful in preparing immunogenic compositions, using disease-specific compounds optionally modalied to include a (I)-reactive amino acid that are combined in crosslinking solution then treated with (II), that can be used in human and veterinary medicine, particularly as vaccines, for treatment and prevention of infections (viral, bacterial, fungal or parasitic), cancers and Alzheimer's disease, also of immune-related or autoimmune diseases. Antibodies against pag are useful as diagnostic cancolumnus and crosslinked proteins can also be used industrially, e.g. in food or leather processing, in cosmetics and as enzyme carriers. The present sequence representes a Streptomyces mobaraensis transglutaminase (EC 2.3.2.13), which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparation of polyvalent antigen, useful in vaccines, comprises crosslinking antigen in presence of biological agent, especially transglutaminase, and derived antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       33

Expression of DNA encoding this protein in E. coli allow large scale prodn. of BTG. An active BTG can be prepd. from the inactive fused protein inclusion body. (Updated on 10-MAR-2003 to add missing OS field.)

The present invention describes a method for producing a polyvalent antigen (pAg). The method comprises: (i) treating an antigen (Ag) in a crosslinking solution with a biological agent (I), and (ii) incubating so that Ag is converted to crosslinked products. The pAg has virucide, antibacterial, fungicide, antiparasitic, cytostatic, nootropic and neuroprotective activities, and can be used in vaccines. The method is useful in preparing immunogenic compositions, using disease-specific compounds optionally modified to include a (I)-reactive amino acid that are combined in crosslinking solution then treated with (I), that can be used as vaccines. PAg, and other related antigenic compositions, are useful in human and veterinary medicine, particularly as vaccines, for treatment and prevention of infections (viral, bacterial, fungal or parasitic), cancers and Alzheimer's disease, also of immune-related or autoimmune diseases. Antibodies against pAg are useful as diagnostic or account and prevention of infecting or set an ensetul as diagnostic or account and prevention of infecting and enset and antiquent and prevention of an antiquent and prevention of an account of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reagents and crosslinked proteins can also be used industrially, e.g. in food or leather processing, in cosmetics and as enzyme carriers. The present sequence represents a Streptomyces mobaraensis recombinant 6X-His example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Preparation of polyvalent antigen, useful in vaccines, comprises crosslinking antigen in presence of biological agent, especially transglutaminase, and derived antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length:

The mature transglutaminase enzyme (BTG) can be derived from two different species. Streptoverticillium and Actinomycetes. It catalyses an avyl rearrangement reaction of a gamma-carboxyanide gp. of glutamine. It introduces intra- or intermolecular formation of epsilon-(gamma-GlN)-Lys cross-linking when an epsilon-amino gp. of a Lys residue acts as an acyl receptor. When water acts as an acyl acceptor the enzyme accelerates the conversion of Gln residues to Glu residues by deamination. The enzyme is cheese etc. It is also used in the prodn. of thermally stable materials such as microcapsules and carriers of immobilized enzymes. The DNA sequence given allows the prodn. of BTG efficiently and in large quantity. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 27-AUG-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA fragment encoding trans:glutaminase - is inserted into vector, e.g. PnJ1053-BTG, for protein expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                349 CCTTACCGTCCAAGTTATGGGAGGCT 375
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US-09-729-264-3 (1-1168) x AAR22651 (1-406)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed sequence in tags in the control of the control of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, formsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic and not also acid sequences of the invention. Note: The sequence data for this and poly and also acid sequences of the invention, whit was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                         Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0 0 0 0 0 0 0 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a Streptomyces sp. containing a gene construct comprising actinomycete-derived transglutaminase gene and promoter. Also described are methods for producing pro-transglutaminase and active transglutaminase. The gene construct can be used in the production of large amounts of transglutaminase. The present sequence represents Streptoverticillium mobaraemse IPO 13819 transglutaminase, which is given in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)

NAME OF THE PROPERTY OF THE PR

```
This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the vector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmaceutical industries. The present illustrating the method of the invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                               Efficient secretory production of foreign proteins e.g. transglutaminase employing transformant coryneform bacterium, simply on industrial scale with direct recovery for use in food processing and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Coryneform bacterium; signal peptide domain; food processing; medicine; cosmetic; transglutaminase; human epithelial growth factor.

The invention relates to a method for producing a foreign protein by culturing a mutant strain of a coryneform bacterium that contains an expression gene construct to secrete the foreign protein, followed by recovery of the produced foreign protein. The gene construct is obtained by ligation of a nucleic acid encoding a signal peptide domain originating from a coryneform bacterium, to downstream of a functioning promoter sequence in the coryneform bacterium and also by ligation of a nucleic acid encoding a foreign protein, to downstream of a nucleic acid sequence encoding the signal peptide. The method is useful for the production of a foreign protein, to downstream of a nucleic acid sequence encoding the signal peptide. The method is useful for the industrially-useful transglutaminase and human epithelial growth factor for use in medicine, cosmetics and food processing. This sequence
                                                                                                                                                                                           Secretion production of foreign proteins by culturing transformant corymeform bacteria, applicable in producing e.g. industrially-useful transglutaminase and human epithelial growth factor.

```
The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polymucleotide encoding it and antibody against (I) are polypeptide, polymucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide.related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transponse in electric cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide pathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases B7-L molecules are useful for allograft transplantation, graft versus host diseases involving chronic immune cell dysfunction or to treat autoimmune diseases involving chronic immune thromboorytopenic purpuse and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crohn's disease and culerative colitis), Grave's disease, Hashimoto's thyroiditis and culerative colitis), grave's disease, Hashimoto's thyroiditis and colitis), grave's disease, Hashimoto's thyroiditis and colitis and except are also useful as immune the propertion or the propertion or the propertion or the propertion or the pare also useful and the pare also agents for the propertion or the propertion or the propertion or the pare also useful as immune thromboorytopenic purpus and psecurate and psecurate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bone marrow and organ transplateation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenias, Guillain-Barrer syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-Lh1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for diagnosing, preventing and treating reproductive, immune and proliferative disorders, e.g. cancer and arteriosclerosis.

The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide—related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and conditions including reproductive disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer calls based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) are useful for the treatment of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of heematopoletic system. B7-L polypeptide callediated diseases and autoimmune diseases. B7-L molecules are useful call modiated diseases and autoimmune diseases. B7-L molecules are useful cort alleviating the symptoms associated with diseases such as systemic immune cell dysfunction or to treat autoimmune diseases involving chronic immune thrombocytopenic purpura and psoriasis, chronic inflammatory cimmune thrombocytopenic purpura and psoriasis, chronic inflammatory cimmune colitis), Grave's disease (Crohn's thyroiditis and

bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. djomerulonephritis), skin disorders (pemphigus and pemphigoid), endorinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenias, Guillain-Barres syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L-H3 are also useful as immunosuppressive agents for

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide peptide of the polynucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide is useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              253
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         770
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     273
of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                73

```
The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are polypeptide, polynucleotide encoding it and antibody against (I) are conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising proliferative domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing prolypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide pethons of pathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases. B7-L molecules are useful
                                                                                                                                           313

immune cell dysfunction or to treat autoimmune diseases such as systemic lupus erythematosus, rheumatcoid arthritis, multiple sclerosis, diabetes, immune thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crohn's disease and ulcerative colitis), Grave's disease, Hashimoto's thyroiditis and diseates mellitus. They are also useful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomentophritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coellac disease, chanemopathies (extrinsic alveolitis), vasculopathies and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L_L2
      alleviating the symptoms associated with diseases involving chronic

                                                                                                                                                                                                              966
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal
activity of (II) or to treat disease states involving (II). (II) is
useful for generating antibodies against it, detecting or quantitating a
polypeptide in tissue, as molecular weight markers and as a food
supplement. (II) and its binding partners are useful in medical imaging
of sites expressing (II). (II) and (II) are useful in medical imaging
of sites expressing (II). (I) and (II) are useful for treating disorders
involving aberrant protein expression or biological activity. The
polypeptide and polymucleotide sequences have applications in
diagnostics, forensics, gene mapping, identification of mutations
responsible for genetic disorders or other traits to assess biodiversity
and to produce other types of data and products dependent on DNA and
amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic
amino acid sequences of the invention. Note: The sequence data for this
patent did not appear in the printed specification, but was obtained in
electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoletic system. B7-L polypeptide plathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases. B7-L molecules are useful for alleviating the symptoms associated with diseases involving chronic

The polypeptide, polymucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; B7-like protein; B7-L; antiinfertility; gynaecological; antitumour; cytostatic; immunosuppressive; antiathritic; antirheumatic; antiinflammatory; dermatological; antipsoriatic; neuroprotective; antidiabetic; haemostatic; antiflyroid; antiulcer; antiallergic; antiasthmatic; nephrotropic; antibacterial; virucide; tumour; cancer; reproductive disorder; graft versus host disease; autoimmune disease; toxic shock syndrome; allergy; nephropathy; skin disorder; endocrinopathy; lymphoproliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immune cell dysfunction or to treat autoimmune diseases such as systemic lupus erythematosus, rheunatoid arthritis; multiple sclerosis, diabetes, immune thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crohn's disease and

ulcerative colitis), Grave's disease, Hashimoto's thyroiditis and diabetes mellitus. They are also useful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restensists. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anatha, thromborycopenias, dullain-Barre syndrome and myasathenia gravis, and lymphoproliferative disorders gravis, and lymphoproliferative disorders gravis, and lymphoproliferative disorders gravis and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L-h4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     683
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   743

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10069-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                           Peptide #7113 encoded by probe for measuring cervical gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP: see AAI3115-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein #7653 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, gene expression, heart, microarray, vascular system,

                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                  measuring human gene expression in a sample derived from human heart (see ABA13105). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
```

```
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, brain expressed exon, gene expression analysis, probe, microarray,

probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
provides a number of single exon nucleic acid

for analyzing probes useful Human genome-derived single exon nucleic acid gene expression in human adult liver.

27; SEQ ID NO 36121; 658pp; English. Claim

The invention relates to a single exon nucleic acid probe (SEND) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their

Spatially-addressable set of single exon nucleic acid probes, used to

Compression of the table of probes and compression in a sample derived from human lung, measuring the novel set of probes to probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung masuring the label detectably bound to each probe of the array; identifying exons in a ewexyotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the ewaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon comprising (a) identifying exons from genomic sequence by the method above mentioned microarray; assigning exons to a single exon.

Comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon.

Comprising (a) identifying exons the exon, where a common pattern of expression of the exons in the tissues and/or cell types using hybridisation or encoded by the corpusors for identifying exons in a gene, particularly using human of the exons should be assigned to a single exon.

Corpus for identifying exons in a gene, particularly using human corpus disease (ILD), familial idiopathic pulmonary disease such as asthma, lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA and for the study of lung diseases such as asthma, lung derived mRNA, and for the study of lung diseases such as asthma, lung derived mRNA, individually be asserted in the study of lung vibrolar provelse, provelse, pulmonary disease (ILD), familial dispendences, pulm Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences complements or the 12387 open reading frames derived from the 12614

```
Novel nucleic acid and encoded nGPCR-x, used to screen for compounds for use in the treatment of mental disorders, such as Alzheimer's disease, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel isolated human g protein-coupled receptor (nGPCR-X). The nGPCR-X can be used for sorreening compounds which can be used to treat mental disorders, thyroid disease, renal failure, inflammatory conditions such as Crohn's disease, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disorders, schizophrenia, migraine, stroke, dementia, depression, Parkinson's disease, Alzheimer's disease, and Huntington's disease. They may also be used for treating viral infections such as human immunodeficiency virus (HIV), type 2 diabetes, obesity, anorexia, hypotension, hypertension, thrombosis, myocardial infarction, atherososlersois, cancer, and sexual dysfunction, ANUSSIO1. AAUSSIO5 represent the amino acid sequences of novel human G protein-coupled receptors, nGPCR-2031 to nGPCR-2140 respectively, as described in the

Contractorised in that they: (1) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene from a relate 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant part of the protein sequence preceding the amino terminus of the mutant part of the protein cap distributed by a new stop codon generated by the frameshift mutation, and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses. The genes that the captibles are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 cresidues, or a di-nucleoside base repeat sequence of at least 5 cresidues, or a di-nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours contractions and cancer cells carriging genes with frameshift mutations.
                                                                                                                                                                                                                                                   Peptides AAY65684-Y66142 are fragments of mutant proteins arising from a
                                                                                                                                              New peptides derived from genes with frameshift mutations, used develop products for the treatment and prophylaxis of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  peptides and DNA sequences can be used for the preparation of a composition for the treatment or prophylaxis of cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7137). ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

```
Feptides AAY65684-Y66142 are fragments of mutant proteins arising from a crameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i) are at least a maino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the morant of the protein cardinate to the carboxyl terminus of the mutant part of the protein sequence preceding the amino terminus of the mutant part of the protein as determined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses. The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 cell cancel of 1 or 2 nucleoside base residues from the repeat sequence. The nucleoside base residues from the repeat sequence. The colleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel composition for the treatment or prophylaxis of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 94 AA;

peptides derived from genes with frameshift mutations, used to develop products for the treatment and prophylaxis of cancers.

Claim 13; Page 29; 166pp; English.

peptides AAV65684-Y66142 are fragments of mutant proteins arising from a frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (1) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant part of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the normal part of the protein as determined by a mew stop codon generated by the frameshift mutation; and civ) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses. The genes that the peptides are derived from, are characterised as susceptible to frameshift periods. mutation by having a mono nucleoside base repeat sequence of at least residues, or a di-nucleoside base repeat sequence of at least 4 dinucleoside base units. The peptides are created by the addition of a least 4 dinucleoside base used base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a composition for the treatment or prophylaxis of cancer

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL161840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                         capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA Sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
from Drosophila and for elucidating cell signaling and cell-cell
                                                                            The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therespetics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABBR30737-ABR2072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Wall D,
New polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance, useful for conferring resistance or tolerance to a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated polymucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having substantially the same activity as the full-length polypeptide. The polymucleotide of the invention is useful for conferring resistance or tolerance to a plant pathogen. The present sequence represents a protein conferring disease resistance used in the invention.
                                                                                                                                                                               disease resistance; pathogen tolerance; plant pathogen; plant; rice.
                                                                                                                                                                                                                                                                                                                                                                                   Goff SA, Moughamer T;

The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid modelic acid; (2) a host cell containing the vector; (3) an isolated or uncleic acid; (2) a host cell containing the vector; (3) an isolated propaptide or its fragment whose expression is inhibited by the antisense compounds or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding cell polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological contains a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for collectional data inhibits acids required for collectional data inhibits acids required to continual processed or solutions and the processed or described to a companied or collection of an organism. The antisense nucleic acids required for collectional data collections and data collections and data collections and data collections.
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this pattent din not form part of the printed specification, but was obtained in electronic format directly from Mush from Mush from Mush from Mush from Mush from Mush of the Milko at this structly format directly from Mush from Mush
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii protein.
                                                                                                                                                                                                                                                                             baumannii; bacterial disease; antibacterial; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    200000

The protein sequence given has transglutaminase (BTG) activity. The DNA encoding this protein has a base sequence which can be used suitably in an expression system using E. coli or yeast as a host. The base sequence can be compared to those given in AAQ24197 and AAQ24200 which are derived from Actinomycetes sp. BTG catalyses an acyl rearrangement reaction of a gamma-carrboxyamide gp. of glutamine. It introduces intra- or intermolecular formation of epsilon-(gamma-GIn)-Lys cross-linking when an cepsilon-amino gp. of a Lys residues acts as an acyl receptor. When water cresidues to Glu residues by deamination. The enzyme is used in the prodn. CC acts as an acyl acceptor the enzyme accelerates the conversion of Gln residues by deamination. The enzyme is used in the prodn. CC also used in the prodn. of thermally stable materials such as conference given allows the prodn. Of thermally stable materials such as an acriters of immobilized enzymes. The DNA sequence given allows the prodn. Of BTG efficiently and in large quantity. (Updated on 25 - MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA fragment encoding trans:glutaminase - is inserted into vector, e.g. PnJ1053-BTG, for protein expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ਨੇ
                                                                                                                                                                                                                                                Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic
                                                                                                                                                                                                                                                                                                    This invention describes a novel bacterial transglutaminase polypeptide. (1) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste. (1) can also be used to immobilize protein fragment isolated from Streptoverticillium mobaraense. (Updated on 17-OCT-2003 to standardise OS field)

Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel bacterial transglutaminase polypeptide.

(I) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste. (I) can also be used to immobilize enzymes and antibodies. This sequence represents a transglutaminase isolated from Streptoverticillium S-B112. (Updated on 17-OCT-2003 to
